

W elcome to SightLogix™ Enterprise . . .

. . . a real-time video-surveillance and security system that employs intelligent cameras that automatically and continuously monitor video to detect and flag security threats. Integrated into a site's established security system, SightLogix cameras—*SightSensors*—sit at the network edge, analyzing video according to a site's alarm policies and relaying two configurable video streams to the site's video management system. Targets are identified both in the video images and in the SightLogix site map, where targets are shown superimposed on a georeferenced aerial site image according to their GPS coordinates.
