SERVICE
BULLETIN

No. **8**

Ercoupe **BULLETIN**

SUBJECT: Battery box drain tube length

1. This bulletin affects Ercoupe airplanes serial numbers 123 to 423 inclusive. It is advisable that the matter be checked and corrected if necessary at the next regular check period.

2. The battery box drain tube on the affected airplanes may in some cases be insufficiently long to protrude $\frac{1}{2}$ inch below the belly skin of the airplane. Where the protrusion is less than $\frac{1}{2}$ inch,

a piece of rubber tubing should be slipped over the present tube and secured in place.

3. An inspection of the aluminum plating adjacent to the battery drain tube opening should be made looking for corrosion. Should corrosion exist, the area should be thoroughly flushed with a soda solution and thoroughly rinsed with clear fresh water.
